

1.04. Fundamentals of Cognition of SvetL Programs, or Biology with Pictures and a Little About the Brain. Part 2

Author: Shkrudnev F.D.

**The brain (almost according to Darwin), or the "SvetL" Program,
as an imitation of A. Khatybov**

Introduction

Modern science has unlimited technical potential, which allows it to deal closely with the problems of the brain. As you know, most of the brain is located under the skull, so the research space is known, and does not require significant costs for storing individual elements of the subject of scientific research.

Almost all countries, including third-rate ones such as Russia, have either Brain institutes or special medical departments. This can be a Human Institute, a Brain Institute (in St. Petersburg), an Institute of Psychiatry, and so on. There are even individual "researchers", such as in Spain, who replace the whole Institute with their personal knowledge.

The main task of research and researchers is to determine whether the brain affects human life. For these purposes, they select volunteers who guarantee that they have a brain; these volunteers are "crammed" under electronic devices and establish the facts of interest to medicine and all progressive humanity. Recently, rumors have been used as a substitute for knowledge, which also gives good results.

One "researcher" said that she "either turned off, or turned on, and then turned off" – either the generators of "SvetL", or the generators (forgetting to specify which ones) around the World, or the Brain (perhaps her own and the experimenters who agree with her). And this is the subject of general discussion by well-known (in narrow circles) experts on the works of Russian scientists, and mainly N. LEVASHOV. (General Petrov is not discussed - DOTA is still too heavy for the Brain).

Based on these studies, long-term planning of pharmacology, production of medicines, clothing, housing, vehicles, recreation, etc. is carried out, as well as knowledge and cognition conferences are held. At these conferences, especially over the past year, in addition to questions about the brain, and the Entity (i.e. the brain), was a detailed image of a disassembled SvetL Program, the work of the so-called dark matter Generator (created by N. Levashov), loading (unloading), installation of Generators (in common - light), as well as their turning on and off, were studied in detail, based on the "seen with my own eyes" and "heard with my own ears". **Studies conducted in this way, recently, have established the fact that there is no brain in a person, and the structure of the person itself turned out to consist of a mixture of solid, liquid, gaseous and other components, and the very concept of "living cell" does not make sense.**

The basis of all scientific knowledge applied in this case, of course, is Darwin's theory, and the monkey that first grabbed the stick; in other words, some individuals, according to Darwin's theory, descended from monkeys.

The erroneous idea of the brain, which was before another expert from the country of Don Quixote and Sancho Pancho took up the task, was brilliantly dispersed in epoch-making conferences and additional columns, purposefully created with warnings and explanations even on the author's websites of N. Levashov (though without his knowledge), but using scientific terminology! Where the concepts of "SvetL Programs", "Brain", and "Essence" came from is not indicated in the warnings. Nor is it explained why these concepts are attributed to and associated with a person...

Of course, the evolution of the brain did not begin with a monkey, but somewhat earlier. The "SvetL" programs have only "recently" begun to "interact" with the Brain.

1. The pre-Monkey period of brain development

As modern science proves, after the formation of the Earth from a protoplanetary cloud, the remnants of dust (not suitable for the formation of the Earth's surface) formed a living cell by chemical reactions.

These chemical reactions can be reproduced by any student in chemistry classes.

Some, of course, may object and betray the terrible secret that the living cell was brought to Earth from another planet. But there is a coherent, time-tested theory of the Big Bang, when the entire universe, or Cosmos, was located at a point. This point exploded, and its fragments formed dust clouds, transformed by chemical reactions into stars and planets. Thus, even if a living cell was brought to Earth from another Cosmic body, this body also consisted of the same dust as the Earth, so it makes no sense to refer to other planets, especially. The method of transferring living cells in Space has already been studied in separate Academies, and the science of Astronomy claims that on Earth it is possible to reproduce any action that occurs in Space. We have recently heard similar fabrications from "well-known" conferences for the general public (but in narrow circles), broadcast from The Spanish warm, but extreme, earth (the Brain likes heat, but provided that the brain is present).

Living cells, having gathered in a critical mass, formed for themselves (perhaps by voting) a totalitarian control system, to which the cells themselves were no longer allowed. Over time, this control system entangled all the cells with the nervous system, causing the cells to **split into two party systems, muscle and bone.**

It is known that the control system took the best places (hiding under the skull), itself divided into two parties (left and right hemisphere). Having a sufficiently strong means of influence at hand, the control system forces all cells to obey by flogging them with an electric current. As the management system improved, it formed a powerful gray-uniformed bureaucracy under the skull.

In the struggle for its existence, the control system created a powerful defensive line, covering the outer surface with a dense network of trenches and ditches - the so-called convolutions (it is established that the more convolutions, the smarter a person is, which roughly corresponds to military terminology - the more ravines on the ground, the better the actions of the cavalry).

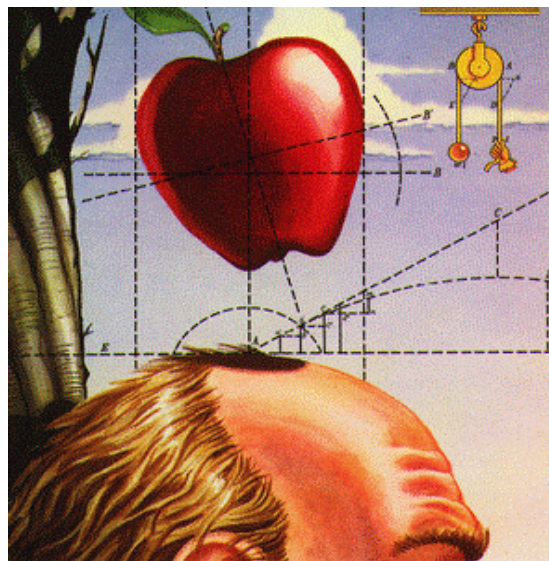

Over time, they (convolutions) have become unnecessary, except as a Museum exhibit, and it makes no sense for a well-organized brain to keep more than one trench (convolutions) in working order.

In addition, you can dump unnecessary information into these trenches, and then you have to restore abandoned trenches. With the advent of phonograph records, there was a suspicion that the brain used the principle of recording on these records and tried to take out the waste of information that lay in the trenches.

Science proves the benefits of gymnastics, but has not yet come to the conclusion that mental gymnastics is better than physical. Using the example of the brain, we can say that the more a cell thinks, the more slender it is. Brain cells, unlike blunt working cells, do not get fat and do not lose weight, that is, they are always in shape. You can "pump" your muscles, but you can't "pump" your brain. Exercise is contraindicated for the brain.

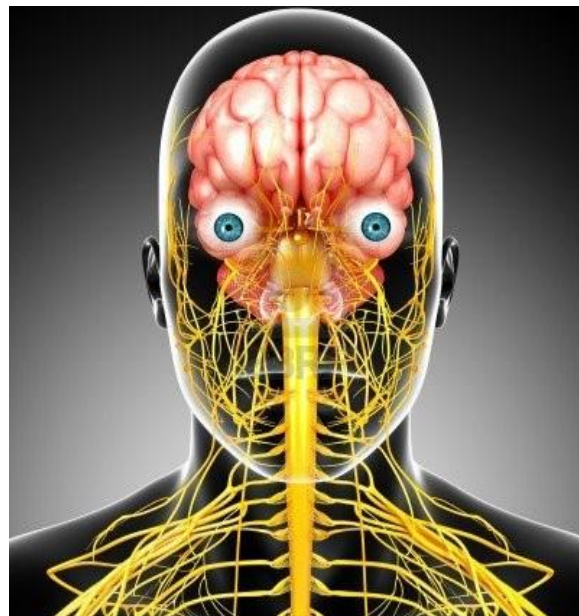

As with the organization of dacha farming, slag removal systems are located away from housing, but valuable waste is closer. According to spectral analysis, sulfur in the ears is close to white oil, which is a valuable raw material. The brain has rationally arranged the structure of food distribution, placing the mouth and nose closer to it, and the most delicious food is first tasted by the brain, and the gnawed remains are dumped into the stomach, where everything is built according to the type of "catering". There is an expression - "melts in the mouth" - it just does not reach public catering.

It is known that the basis of the thought process is gravity. An example is Newton's Apple. The brain cannot withstand independent flight in gravity - if the brain falls from a height of even 10 meters, it will break, at the same time, the working cells will jump on their feet. At the same time, the reverse effect, expressed in the fall of foreign objects on the head, for example, an apple, does not cause any functional disorders of the brain, but improves the thinking process, while the fall of foreign objects on the working cells causes injuries, fractures, and the condition of the working cells deteriorates sharply. Therefore, even in football, they try to catch the ball with their head, and not with their feet (so as not to damage their legs).

It is noticed that when you are in the toilet (when removing slag from the intestines), you show interest in reading. There is nothing special here - a change in the general gravitational component leads to an activation of the thought process.

Given the role of chemical reactions in creating a control system, the system itself is thinking about the problem of automating all functions by replacing the bloated staff with a transistor analog (artificial intelligence). Like all people's deputies, the management system is particularly scrupulous about privileges - from food to the environment. If an ordinary cell, for example, is quite satisfied with right-turning sugar, then the control system is sick of it. If the bone worker is quite satisfied with any atmospheric pressure, and even its instantaneous changes in a wide range, then the scrupulous control system immediately closes all windows and doors, clogging itself. Over time, it became not profitable to manage from one center, so local self-government bodies were created - the spinal cord, with the transfer of motor functions to it. Some biologists believe that the spinal cord was formed first, but it is appropriate to recall that the brain did not follow the path that is used in unintelligent life - to choose everything for itself.

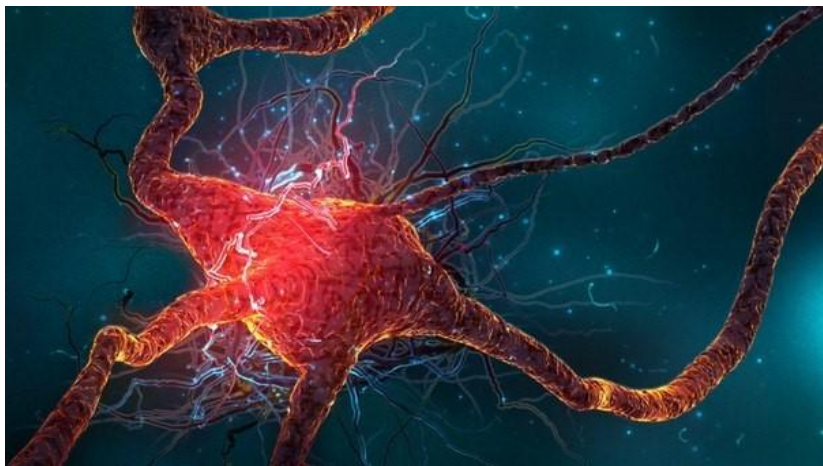

For example, biologists know that unicellular cells perfectly process fats and amino acids, which are higher in structure than the unicellular ones themselves. The brain ignored all this and created enterprises for such rework, without interfering with the production process. Of course, the liver, kidneys, bile ducts, gallbladder, etc., perform the same functions as single-celled cells, but the brain does not participate in this process. Of course, the brain is the smartest cell, so for the rest of the cells, it is enough to use a binary code like "hay-straw". By analogy, the transistor analog of the brain should work according to the same scheme - "bit - no bit", which means "beat - no beat", that is, there is continuity in the management.

Since the conceptual framework of modern physics is based on the model of the Bohr atom, and everything we see can be felt with our hands, the brain tends to be in a state far from plasma. Recall that the material body is the basis, and the next transition process (especially the final one - plasma) is less attractive, that is, everything that is known about the surrounding world:

Solid material body → liquid → gas → plasma.

Of course, the brain prefers a more stable base, that is, closer to the solid material. The state of plasma, where, according to Landau, the magnetic pulse is ahead of the electric charge, is not acceptable for the brain, since there will be no one to control.

Replacing the control system does not lead to any serious changes, so by measuring (using a voltmeter) the voltage and current in the neurons, you can safely choose the best analog, conduct cloning. The brain never gets sick because it's smart. Only the working cells get sick. If the brain has mild ailments in the form of a headache, it is removed by using simple **tablets such as aspirin**. At the same time, millions of drugs have been developed and manufactured to treat working cells. The brain, for example, cannot get sexually transmitted diseases or AIDS, because (according to biology) it is the business of working cells to rub against foreign objects. The brain, of course, is not involved in sexual intercourse, nor in the growth of the fetus (in women), all this is the result of chemical reactions and friction of epithelial cells (according to modern biology). Similarly, with the help of sticks and flint, the ancient descendants extracted fire - here both friction and chemical reaction.

To listen to music, ears are attached to the brain, which are the source of all low-frequency information. Over time, the brain created (from the waste of the epithelial cells themselves) an intelligence service and a receiving and transmitting center for communication with residents, the so-called cerebellum, which supplies the brain with all the latest news and advertising.

The most valuable organs have a double (eyes, ears, hands, feet), low-value ones do not have a double (nose, mouth, penis). Relatively low-value organs, science has the opinion they sometimes work independently, then causing the brain's displeasure with the consequences.

A particularly valuable brain is covered with lime solution when it reaches perfection and stored as a reference. For better preservation, especially valuable cells are transmuted into coal.

To prevent the Cosmos from harming the brain, it is surrounded by the Hubble sphere, and the Cosmos is not allowed to get inside this sphere. Naturally, the Cosmos can't know what's going on inside the Hubble sphere. Like all material bodies, inside the Hubble sphere, the brain is subject to collapse, that is, compression. In medicine, there are varieties of this process: menopause, sepsis, schizophrenia (brain division), paranoia. Like all normal closed-loop control systems, the brain is able to view itself **(the eyes), listen to music played by a number of brain cells (the ears), and perform cosmetic and major repairs (surgery)**. The highest achievement of the brain is the thought process, when material bodies, moving on opposite courses, exchange information (see Brownian motion).

It is proven (see biology) that for some time working cells can do without the brain. This phenomenon is especially evident in a large crowd of individuals, **listeners of fascinating Spanish conferences**, but not only those who previously had a brain (and the ability to use it for thought processes).

The structure of the brain (see biology) is quite simple. An analog can be the structure of the body, for example, a tiger, shown in detail in the movie "Striped flight" by a trainer.

Each selected part is of undoubted interest to the cook, so a similar idea of the brain (biology, medicine) leads to the idea that not only the human body, but also the brain is considered by modern science only from the point of view of the cook.

If the explanation of the trainer that the tiger has an udder, causes laughter, then the explanation of biologists, as well as Leading well-known Internet Conferences that the gray matter in the human skull is the brain, does not cause laughter. It follows that the foundations of modern knowledge about the brain were laid by cannibals, and these foundations are acceptable to all civilized humanity. From the point of view of an Ogre, not every brain is delicious - the brain of a young lamb is considered a delicacy.

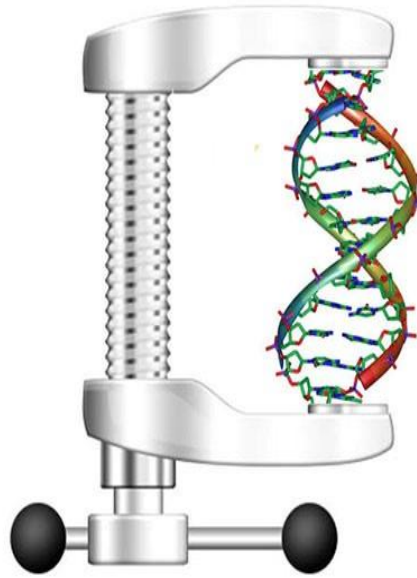

The perfection of the brain at the present time lies in the fact that none of the working cells can reproach the brain for developing in the wrong direction, and the majority opinion, as we know, is always true.

The result of brain development is all the processes that occur on Earth, including the formation of weather, although the brain itself does not know about it. Once perfected, the brain is able to look beyond the Hubble sphere and view the rest of the Cosmos as its sphere of interest. At the same time, having met similar proto-proton formations on its way, due to its perfection, the brain is able to form an additional control system, connecting the new System to the civilized world.

2. An unscientific point of view on the Brain, expressed by a dilettante from science, for an initial understanding of the "SvetL" Programs and the Brain itself, with which the Programs (and not only) interact.

The brain does not exist in our representation, or imagination, or touch. We cannot examine the brain under a microscope, cut it open with a scalpel. We don't know what the brain is at all. Before proceeding to consider any "interaction" with the Brain, and even more so with Programs, let us try to understand this phenomenon using **OBJECTIVE DATA, a different KNOWLEDGE STRUCTURE and a different TOOLBASE**. Note that the instrumental base, built on a horse literacy, is not suitable here (the basis of modern physics is horsepower). Let's consider not only the Brain, but also the Information field, without which the Brain cannot exist.

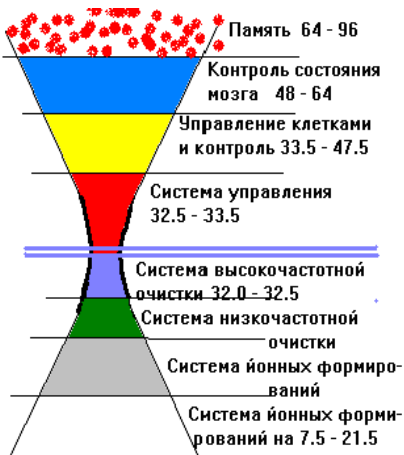

When considering the phenomenon of the brain, torsion bars and information cannot be considered as evidence. There are no technical tools for analyzing the brain - you can only analyze the consequences (at the proton or biological level). Changes in biological structures do not mean changes in Brain structures (read - essence), but indicate the properties of the Brain to protect itself from adverse conditions by changing the properties of high-frequency lymph.

All information about the structures and properties of living cells is contained in the Brain, not in DNA (DNA contains some incomplete copies). In addition, the DNA itself is a kind of "conveyor" on which products are assembled.

The information embedded in products, for example, after assembly, the car is filled with petrol and ready to move, but no one will refuel the conveyor itself, however, biologists are struggling to find a reason why the conveyor is not moving, and not paying attention to what components are available for assembly. They cannot be seen by any modern technical means. Conventionally, the main functions of the Brain are shown in the figure.

The antineutron space forms lymph, around which a proton ion space is formed by reducing the potentials of the initial frequencies. This proton space is endowed with the properties of its own control and perception of the environment, that is, the perception of space-time. However, this is the lowest level of perception. It is accepted as a standard by science.

All modern medicine works in proton space. There are no ways to move or control from a lower space to another space, when trying to change the state of a living cell, the control system is simply disconnected from the Brain (Entity), and the living cell exists only as long as the potential of the magnetic pulse of the cell itself is consumed.

Мозг - сложнейший комплекс, его нельзя создать из пыли /The brain is a most complex complex that can't be created out of dust.

Мозг - результат многомиллионлетней работы по формированию биоструктуры (человека). И, конечно, мозг не может быть сформирован сам по себе из пыли с использованием химических реакций./The brain is the result of many millions of years of work on the formation of the biostructure (human). And, of course, the brain can't be formed by itself from dust using chemical reactions.

Мозг - одновременно связанное состояние 3 пространств - нейтринного (высшее), антинейтронного и протонного, или ионного./The brain is a simultaneously connected state of 3 spaces - neutrino (higher), antineutron, and proton, or ion.

Здесь следует заметить, что и Генератор "тёмной материи", используемый сегодня в Программах «СветЛ» (см. Н.ЛЕВАШОВ «Источник Жизни» 1-10), создавался Николаем Левашовым по этому же принципу./Here it should be noted that the "dark matter" Generator used today in the "SvetL" Programs (see N. LEVASHOV "The Source of Life" 1-10) was created by Nikolai Levashov on the same principle.

We must not forget that **any living organism can exist only in the information field; outside the field, the organism consumes irrevocably the reserves of proton space potentials.** The end of reserves leads to the separation of spaces, and the ionic structure turns into a normal inertial mass, into sand. The main task of the SvetL Program (the Generator itself) is to constantly "analyze" (according to N. Levashov - scanning) the situation with the owner of the "Device", to prevent this from happening.

Let's not forget that the measuring system is built on vision, and the space - time ratio is determined by the clock interval of the magnetic pulse. The distortion of this ratio is not only a disease, but also the result of "technological progress", and changes in the conditions of the Brain's existence in the current Noosphere.

In recent years, science has been shaking humanity with discoveries, and with information on these discoveries. Already housewives are not the only ones demanding to bring their diseases into line with the new achievements of science. This includes cloning, and obtaining codes of the human genome, etc. Dear housewives, as well as organizers of Conferences on similar issues (both in Moscow and in Spain)! Not everything that is written on the fence is behind it.

At home, you (Housewives and organizers) can conduct a fairly simple experiment. Take a mattress and try to push it (without dividing it into parts) into the toilet (you can put a pillow in the sink drain in the kitchen). At the same time, the pressure on the mattress (pillow) should not exceed a light touch.

If the experiment is successful, you can continue to hear about the achievements of science.

Let's explain to specialists: after receiving a blood test, you notice the presence of red blood cells (a disk with a diameter of 7-9 microns). But in humans, more than 90 % of blood vessels have a diameter of 1 micron. The heart creates a pressure of 44 mm Hg. Quite respected luminaries of science report on the question (how do red blood cell gets into and move in the blood vessel) that it simply stretches (under the microscope, it does not want to change shape).

In 500 years of medicine, no one has paid attention to these little things, so you can report great victories over the Mind (even if you are in Spain and spend precious time on it), without paying attention to the little things. There are hundreds of similar examples, especially in the field of medicine. It is known that mathematics is used in medicine, but mostly statistical.

The main properties of the Brain, and especially in interaction with the "SvetL" Programs, include the use of some remarkable numbers - the Golden ratio, the number 54, and the number 12.

Regarding the number 54, there are several examples::

- Golden section of the mathematical sine function;

- angle of inclination of the plane of the pyramid of Cheops;
- Golden section of the symmetry system;
- the number of active electric charges in an atom during beta decay;
- length of toilet paper;
- number of seats in a reserved railway carriage;
- the number of combined regiments participating in the parade on red square, and so on.

You can give a huge number of examples of using the number 12, but when building biological structures and especially high-frequency lymph, these numbers play a special role.

Any biologically active structure does not develop exponentially, but in an octave, and uses the solid geometry of the octave.

When the "SvetL" Program works, in interaction with the owner's Brain, not only the dependencies of the existence of a living cell are determined, but also the constants that are the basis or limit of the use of the external environment by a living cell.

WHAT IS AN OCTAVE? (recently, frequently asked question).

Imagine a wave that has 2 vibrations per second. The powers of this number are the octave. The limit state is 54 octaves. Octave 54.375 is gamma radiation. The 48th octave - sunlight and so on.

Existing science has its own system of knowledge, built on the Bohr atom, the periodic table, and Willy's biology (where the frog has a pancreas, that is, in the period between croaking, it chews salami with pleasure). One of the constants is KVA.

This is not an incident of the Academy of Sciences - it is just another stage of knowledge achieved. The next stage of knowledge will also belong to the Academy of Sciences, and not to those academies that use the results of the Academy of Sciences and introduce garbage into science in the form of information and torsion fields. All the academies created in recent years use not only the accumulated experience and knowledge of the Russian Academy of Sciences, former secret materials of the 1st departments of various institutions, but also misinform the public, using the ignorance and illiteracy of society's management systems.
