

Sugar, Part 3: Secrets of Grapes and the pancreas.

Autor: [Zhuravlev V.V.](#)

"Where there are vineyards, there is civilization. Wine protects from barbarism"
Hubert de Montreuil.

"There is no greater pleasure in the world than to feel the fragrance of a flowering vineyard..."
Pliny the Elder.

*"There are two reasons to drink wine: to heal from thirst and to prevent it. In my opinion,
prevention is much better than treatment"*
Thomas Love Peacock, English poet and writer.

*"If wine suddenly disappeared from the face of the earth, there would be such a terrible void in
the consciousness and health of our planet, which would be more it is more terrible than all
those problems of immoderation for which wine is indulged persecution"*
by Charles Baudelaire.

One Person, let his name be "Italian", told me, quite recently, in July 2021, the Words that marked the beginning of this article. His meeting with me took place at the country cottage, although no one could see him, even if they really wanted to, I stood and looked at the grape leaves, setting new "SvetL-Flora" Impact Programs for this plant, considering enlarged leaves. He appeared suddenly, as always. He was wearing an impeccable gray suit, next to which any "Brioni" pales, which in comparison with his suit is the ridiculous apron of a buffoon obsessed with money and flaunting his importance. He said: *"As I see, you are making progress. It's beautiful when labor beautifies. I mean your garden, of course. You're already planning to describe your contact with bees, continuing your cycle of research about the mysteries of sugar, as you say. Worthy and useful. Pay attention to the grapes, as well. This is not just a Biblical plant, along with figs and olives and other products that previously grew in the Eucharist area. This was previously the name of ancient Judea, on the territory of modern Palestine. Grapes stand apart, as does winemaking. In the name of this drink, many centuries ago, many popes blessed their rings for a campaign against the godless, in other words, Muslims. Pay attention to the fact that all the Crusaders, or as they were called, the Franks, brought with them not only wine, but also generic grape varieties, which later grew into huge gardens in their new possessions in the Holy Land: Palestine, ancient Judea, Antioch, and even modern Iran. The best vineyards were laid in the floodplains of oases, where they drew water for lifeless desert slopes and spurs, turning them into fields of grape secrets and no less significant vines. I remember this term, newfangled, was already in use in Europe at that time: "VICA". This was the name of the unique grape orchards that stretched for many kilometers around, changing the climate in such an inhospitable region. Although, there were a lot of forests and the climate was different than what it is now. Many varieties were not bred at all during crop breeding. Here is an unknown variety of "Pabetje", for example. History has erased the name of this worthy Count from the annals, for obvious disagreements with the Pope of that time and his activities. Count Ramon de Lacleuse of France. Collector of varieties, enthusiast. He grew red grapes "Sarvone" and a unique variety of green-pink grapes from Florence. And in the east, "Pabetier" turned into the marvelous "Esmina" variety, strongly smelling of pomegranate notes. Wine from this variety has already been called "Dzammir", which means "Charm" from ancient Arabic. In 1396, the variety of this wine was already actively sold by Eastern merchants even in Venice. The Pope of Rome had an agreement to trade wine from France and Spain with a number of particularly wealthy merchants from the East, for the needs of the nobility. The trade was a secret, of course. Young girls from poor families were sold to harems in the east, as well as people into slavery, who had been guilty before the church and the payment was taken in gold and rare spices, including the "Dzammir" variety from the "Esmina" grape. Grapes are firmly embedded in the culture of People around the world. Without exception. A good topic for an article."* And disappeared.

"There is no punishment and villainy that cannot be atoned for with a note of blessed wine. Forgive every transgressor who brings me a cup of wine with a fragrant divine. Kill them all. God will sort out his own."

Simon de Montfort, head of the Crusaders.

"For the blood of Christ I will pay with a thousand fires and lamentations, I will shed rivers of blood and wine until I have destroyed this fortress and the vicious Cathars. Let blood flow in rivers as wine in the kingdom of God.

Adell Lemien, siege of the fortress of Montsegur, 1243.

"After this victory, rivers of wine and rivers of red happiness will flow. May Montsegur burn in the name of our lord."

Fiesta Larozzo, siege of Montségur, 1243.

There is plenty of madness in our world, as well as unjustified cruelty. What I wrote above happened and it must not be forgotten, even despite the fact that many of the Powers That Be in those centuries sought to subject everything to oblivion. In the name of wine, called "the blood of Christ" by the Catholic Church, terrible deeds and atrocities were committed. And after these same atrocities, these blatant cruelties were washed down with wine.

However, despite this, grapes have played a key role in the history of the development of many peoples, laying deep roots with their vines in many cultures, giving employment to many generations of People around the world, starting with vineyards, ending at the final stage with the sale of wine in various retail outlets.

Of course, People are not to blame for the madness of fanatics, no matter what they hide behind. And the article is not devoted to the atrocities of the church and Inhumans of different times, but to *KNOWLEDGE* that was previously hidden and has now been published, because, as the Arab philosopher Abulkasim Firdousi said: *"where the Truth emerges through the fog, deception is defeated there."* Let's start our study of grapes, which will turn out to be much more for you within the framework of your awareness - than you imagined about this culture at the moment.

Please note that grapes are the only crop that is studied by a whole science - *"ampelography"*. No culture has received such an honor so far. Thousands of People are involved in this field of activity. And it seems that everything is calm and goes on as usual, but over the past few years there has been more and more information that vineyards are experiencing serious problems and wine producers are at some loss. Then the heat destroys the plantations, then diseases rapidly reduce not only the harvest, but also destroy the vines themselves in the vineyards. It seems that grapes, as a culture, are dying out and this trend is growing, despite all efforts. It is also observed with: *coffee, cocoa beans, olives and many other plants*. Therefore, it is important to understand the background of grapes in order to find out for yourself: does such a significant and memorable culture have a future for all Mankind and what to do with it next: grow, eat, cook wine or what in general?!

Considering the problem of grapes, after a long study of materials, including Biblical legends, extracts and stories, I came across a part of the text where it was explicitly stated that within the framework of the Bible, there are clear footnotes that grapes appeared after the Flood. If we consider the information about the Flood, not from the point of view of religious perception, but through information from the "NII TsUS", then here is a description of the real cause of the flood and the events of that period during the intervention:

6534 BC to 6234 BC (300 years):

Preparation for the fourth stage of violent intervention.

- *Preparatory process of software reinstallations of a controlling nature.*
- *Cleaning up from the consequences of the experiments carried out.*
- *The surface of the Earth was filled up to $h = -1,200$ m (relative to the current level), 8,640,000 energy buses of the interpolar direction were laid on the resulting surface (geographers have meridians, although there are not 360, but a few more) connecting all Control Complexes and planted objects.*
- *Nodes (control servers and energy distribution servers) have been formed.*
- *After this fine engineering, the entire complex "installation" was filled up to $h = -100$ m.*

- From the hydrophone layer of the atmosphere, huge masses of water 1,500 m high fell onto the Earth and, from that moment, sea water was formed for the first time - this is the "universal flood".

- The surface of the Earth has taken forms close to modern ones.

3761 BC:

- Many more fleeting experiments were carried out with the received people in order to bring them closer to the appearance that a Human had before the intervention of the Earth.

- By mid-September 3761 BC, this process of their figurative similarity was completed (meaning the tale "about the image and likeness" in the Bible and other legends):

http://www.salvatoreem.ru/?page_id=2351.

Creating People in the Image and Likeness of the true inhabitants of our Planet, the Ebra conducted many hybrid crosses, the result of which was then ruthlessly eliminated. But, no matter how much the Ebras tried to fit the People they created to the Image and Likeness of a *Proto-Human*, there was one huge problem: when the octave of the *Proto-Human* Brain was lowered (as a result of interventional step-by-step intervention), the physical body lost all working capacity, since it could not be controlled by a *cubic Brain* of low octaves. Then the active process of hybridization began, to create and impute organs that had not previously existed in Humans. "Crutches" began to appear in the form of imputed organs and at the same time there was a simplification and destruction of the harmony of the symmetrical Human body. The body was categorically unsuitable for life and even more so for management, as if it was de-energized and not functional at all.

The physically dense body not only could not give the required number of high octave frequencies, which led to the need to resort to *tritium*, it could not provide even sane work of the physically dense part of the brain, despite many efforts. According to the observations of the Ebr and the analysis of the information received, they managed to find out about some of the properties of previously existing *nectars*. The spiders could not find any details, the only thing they realized was that the nectars had a specific taste, more similar to the word "sweet" in our modern understanding.

Not knowing the properties of sugars, the Ebers decided to ensure the saturation of the created flesh of People with at least some energy - to introduce *sugar* into the life of the individuals they created (you and me), as we now imagine it. This is how the first semblance of *glucose* appeared for the first time. However, it was also necessary to create organs whose chemical reagents in the newly assembled body would be able to help cells absorb this product. From that moment, the process of *creating the pancreas (implementation, imputation)* began. No less interesting is that such a process did not occur without significant failures and losses in the form of deaths. This is confirmed by a number of findings in the form of records of ancient doctors about symptoms indicating the similarity of modern *diabetes mellitus: pain, sweet urine, thirst and unhealed wounds*. Sugar is not just a complex cubic structure, but also a tool for bringing the Brain through a certain saturation of nutrition (energy) and information to an adaptive and active state - to solve problems and goals within the framework of the tasks of the *Ebrov Control System*. The most important organ in this regard is the *pancreas gland* and the *liver* can also be attributed there. And to put it another way – sugar is a tool for bringing the Brain to a state of guilty control. What a mockery from the Ebrov System. The symbol of the spider cubic brain is produced in mass volumes and every day in front of billions of People in the form of a sugar cube. Think for yourself: "*sugar cube*" - "*sugar cube*". That's all in plain sight, and I also did not see this nuance at close range until the moment of studying this issue and writing an article.

Before you continue, think about how much sugar you consume every day. I'm not talking only about *granulated sugar* from *sugar beet*, or *cane*. I'm talking about artificial *sweeteners* and completely *tasteless additives of synthesized substances* resembling sugar. They are contained in all food products without exception at the moment. What unites *sugar and alcohol*?! The fact that even from the slightest dose, a person becomes manageable. If alcohol nearly removes the psi-protection and opens the Human Brain to influence, sugar simply creates additional ways and levers of controlling the Brain and the Person himself, respectively. I wonder what the so-called powers that be would do if all People suddenly refused any dose of sugar and alcohol?! And then also: smoking, watching TV shows and entertainment shows, swearing, football matches, pornography downloading energy from the viewer. Excluding even these factors of influence listed above, it will be very difficult to control you and turn you into a kind of cattle and a moral slave. Here everyone already makes a choice, or does not, which is also a choice. With the ensuing consequences. As a rule, from the Brain of Brains. Within the framework of dullness and degradation.

Understand and think again: for thousands of years, kings, nobles and ordinary peasants have not been given vodka, Calvados, Martini, cognac and absinthe, as well as moonshine! They drank wine, and commoners drank intoxicating beer (from this word intoxicating drinks – from hops), as well as barley and oat beer. The general process consisted in the use of special fermentation yeast, which were provided by the Ebrov System to change the functionality of the intestinal microbiome and ensure its functioning, especially the large intestine, in which there are trillions of bacteria. The wide distribution of the varietal base of grapes and various wines from it, created using different production technologies, was strictly necessary for a specific territory with special conditions for accompanying certain Brain genotypes. In many Genotypes, with the help of yeast and wine, as the final stage of fermentation, the processes of bringing the function of the intestine and digestive system to an adequate working state, took place. Therefore, many southern peoples needed good wine and it is there that some of the best wines are still produced: Armenia, Georgia, and in general the territory of the Caucasus and even Transcaucasia. By the way, grapes have a great effect on the functioning of the liver and gall bladder, perfectly accelerating the outflow of bile. But this applies more to red and pink grapes.

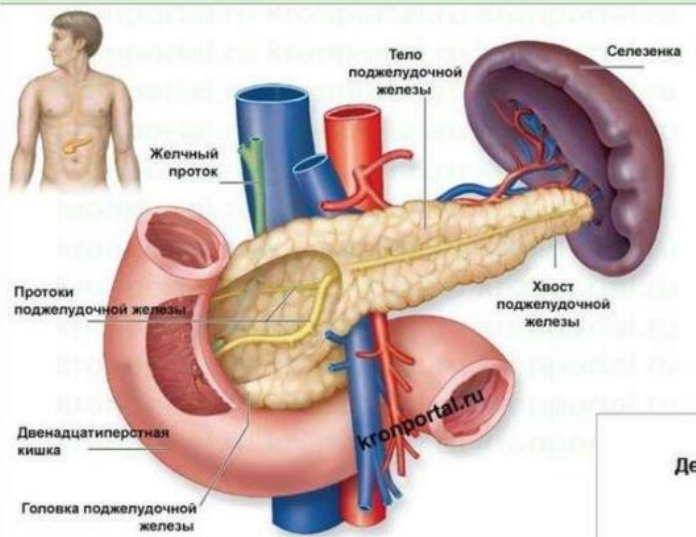

There is another important nuance of grapes: the best varieties were obtained in the valleys of extinct or still active volcanoes. And not at all because of the fact that there is a magma-warmed soil and a special microclimate, but because in these places' information outputs (transmission of information from Control Complexes) were carried out, with the help of which the grape culture complemented its functionality. Or rather, it was supplemented.

But even more dangerous is the effect of sugar on the Brain. Heroin, hookah, hashish, synthetics and other drugs are pleasures for stupid mediocrities and outcasts. There is no more dangerous drug than sugar: either industrially produced from beets and cane, or synthesized by

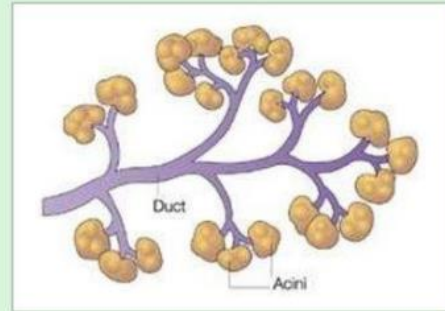

chemists and biologists. And a much larger number of people, an incomparably larger number, are dying and dependent on this drug. Almost all of them.

During the research process, I assumed that I would write a lot about sugar addiction. But, already correcting the article, I came across WHAT made me leave my previous plans on this issue, because the information received exceeded even my expectations, if only because I didn't expect or imagine this. I discovered a completely different nuance to sugar addiction. Which affects all endocrine functions and hormones, so there is no point in even analyzing this. And the answer lies in the pancreas. In close relationship with the liver and adrenal glands. But to put it very briefly, sugar addiction is: *"the process of rigidly formed, weighed and adjusted standardization of the density of saturation of organs with glucose, transformed at the field level by pancreatic hormones (not only insulin), - with gradually increasing failure of the efficiency of some cells of the pancreas, causing the transformation of the same glucose into a product to be assimilated by the cells, with the subsequent violation of the existing form and parameter of glucose in the cells, - with the inability of the Brain to recognize what should saturate the organs with the necessary energy for vital activity. One of the causes of diabetes is the violation of glucose standardization and the impossibility of its transformation by the pancreas into energy for the organs. And this suggests that diabetes does not arise due to the destruction of organs from undigested sugar in the blood, but from the formation of a stressful immune state in which the Human Brain actually begins to reject the body because it cannot even adjust its energy supply. And the destroyed pancreas no longer performs its functions. The brain has nothing to convert glucose and there are no tools for this. And the Brain has only one way out for glucose assimilation - to withdraw the accumulated glucose of the previous standard from the organs and distribute it to those that suffer more from energy deficiency. In this case deformation of organ cells at other qualitative levels occurs and their dysfunction (multi-organ failure) increases. But the Brain itself cannot restore the reference state of glucose for it, especially taking into account constant insulin therapy, or the strictest diet. Paradoxically, it is the low-carbohydrate diet of diabetics, aimed at preventing a serious rise in blood sugar, that prevents the Brain from making connections with the almost destroyed pancreas. If the Brain could regenerate at least 30% of Langerhans cells, it would be possible to reverse the process. But you can't do it on your own without outside help. Diabetic coma occurs not because of a critical increase in sugar levels, but because of an explosive attempt of the pancreatic cells to cause the release of digestible insulin by the cells. And the Brain perceives such attempts as a riot of a dead organ that threatens the body. And the Brain itself almost falls into a coma, changing its state. That's why they say, without understanding: diabetic coma."*

Поджелудочная железа

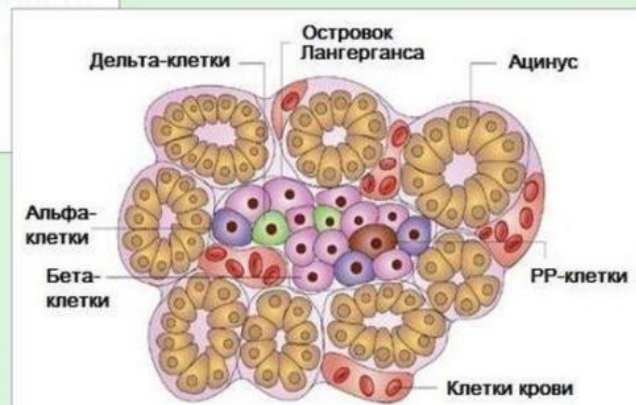

Ацинусы, секретирующие панкреатический сок

Гормоны

1. Глюкагон (альфа-клетки)
2. Инсулин (бета-клетки)
3. Панкреатический соматостатин (дельта-клетки)
4. Панкреатический полипептид (PP-клетки)

Left Side:

Бета-клетки/Beta cells

PP-клетки/PP cells

Клетки крови/Blood cells

No less interesting is the fact that grapes can be consumed even by people suffering from diabetes. Due to the low glycemic index. Paradox: grapes are the most saturated culture with a variety of sugars, but they do not cause a sharp jump in blood sugar, which does not immediately load the pancreas at a rapid pace and does not overload the liver with the transformation of substances from one form to another (glucose storage).

Moreover, if the pancreas is not damaged and is healthy, then grapes of red and pink varieties, taking into account eating them with seeds and peel (*not twisting into juice*), contribute to the regeneration of pancreatic tissue to one degree or another. I conducted an experiment with the *smells and sounds* of the pancreas. The gist of it was that I made a comparative control before and after I tried the grapes. Since I didn't have my own grapes this year, I just bought sweet grapes and tried this experiment at home. Here's how it can be roughly described: *"by analyzing the reaction of the pancreas to the berries and fruits that grow in the area of my cottage, we can note the most pronounced reaction to substances contained in grapes. It was as if the pancreas received some form of pleasure when it promoted the absorption of glucose and fructose from grapes. The color gamut varied from the green spectrum to the green-blue color, when decomposed into components and the smell was purple spectrum, with a pronounced taste of yeast during oxidation. The most interesting thing is that if you really describe the process of reactions in the pancreas to grapes and sugar in them, then you can make 336 equations in which 1236 hormones and enzymes will participate, only a few of which are known to endocrinologists at this time. Moreover, at the moment of converted the sugars from grapes, the greatest reaction and change of substances can be observed in the neurons of the Brain and blood cells. An equally strong reaction of the pancreas to apples, plums and pears, as fruits, is the closest to those that grew earlier on Earth before the intervention. But what about grapes, as with culture."*

Grapes were also created in the image and likeness of a culture that previously grew on Earth. The culture was of bush origin, the berries grew on branches. The name of this plant was more like a sound message with a certain spectrum of colorful overflows of frequencies. If it is possible to decipher this sound as much as possible, then it sounded like an "overflow". A subspecies of a single bush growth was the plant "yastarnik". This group of plants did not have vines and lianas in the form that is now observed in the vine.

In general, the very form of vines and lianas has a parasitic, predatory nature. This is well observed in the tropics and equatorial regions, in jungles and tropical forests. Give modern grapes and hops 5 years and they will fill your entire dacha and cover everything they can. The most obvious approximate version of the *proto-culture* is the *gooseberry*. It is not just called the *northern grape* for nothing. The closest possible similarity of *proto-culture* with one nuance: there was no such sunlight before and there was no such illumination, as well as the reaction of fruit ripening and sugar filling during reactions with the rays of the sun. The lighting of the Planet was formed on completely different principles, so even on this example it is impossible

to draw an analogy of grapes with proto-cultures. Under the conditions of our Planet before the intervention, it could not have existed, just like there was no sugar in it.

The nature of simple nectars was completely different, even despite the sweet taste and pleasant smell of fruits. Have you ever thought about why sweet fruits smell the same and sometimes differently?! Such a taste reaction is also a process of hybridization and experiments with sugars for different territories and Brain genotypes. Therefore, the category of sweetness for proto-nectars is inapplicable, because even the taste sensations themselves were different and were transmitted and felt differently. The question remains: what is the future of grapes and vineyards, is there a future for winemaking?!

Based on my personal experience, I allow myself to express my opinion, which is not the Ultimate Truth: I think that there will be no *winemaking* and *alcohol* production, as products that affect the Brain (drugs, in fact), as well as sugar production on an industrial scale from any type of product, and even more so from chemical substances.

Based on my interaction with grapes using the "SvetL-Flora" Generator, I made a generalizing conclusion over several years that: *"the fate of grapes as a culture has not yet been decided. There is a tendency to its mass disappearance and the disappearance of winemaking in general, as the logical conclusion of the cultivation of such a culture. But there are a number of proven*

and verified changes in the culture itself, suggesting that if the Control System takes into account the experience of changing a number of features of grapes that have been obtained, there is quite a chance for a complex, but still, transformation of grapes into a very significant valuable culture, but already within the framework of a food product, without alcohol production. There is no question about it at all. Perhaps it is the massive increase in planting areas that will allow modern winegrowers and landowners to preserve their craft, but with a reorientation to the cultivation of environmentally friendly and modified grapes. I can give advice from the category of my observations: grapes react most wonderfully to the proximity of gooseberries, especially at the pollination stage. Even if the flowering period is different. Maybe I'll touch on the topic of pollination in one of the articles. Even the psi-fields of grapes and gooseberries bring each other into some form of harmony. Moreover, I believe that the preservation of grapes as a crop will be important within the framework of preserving the cultural heritage of civilization. In the context that many vineyards are located next to very beautiful castles and ancient estates that are hundreds of years old. There is a prospect, but I cannot give guarantees, it does not depend on me. Alcohol producers should be upset."

Be that as it may, I said what I considered necessary and important. Perhaps this article will provide food for the Mind for some, while for others it will cause information hunger due to the fact that there seems to be little information provided. Be that as it may, the research will not end and will continue. And information will be provided. Regardless of the attitude towards it. The meaning of this will not change. Just like it doesn't matter who thinks what. The only thing that matters is what really exists and WHAT will happen next. As my FRIEND said.

Vladislav Zhuravlev, 23.01.22, Kursk.
