

2.03. Hair

Author: RNTD Team

The commandment of God Svarog says:

“Do not cut your fair hair, your hair is different, but with gray hair, for you will not comprehend the Wisdom of God and you will lose your health”

To solve the problems existing in our world, first of all we must admit that many of our basic ideas about reality are wrong. It may happen that the main part of the solution looks at us every morning from the mirror.

What is a hairstyle - is it a personal preference, is it fashion or convenience? But is it that simple?

Everything has its own strictly defined function that serves the survival and proper functioning of the body as a whole. Each part of the body has its own reason for existence.

There are quite a lot of interesting facts about hair from the past, and all of them are not devoid of deep meaning and logic.

- During the Vietnam War, special forces of the Military Department sent secret agents to American Indian reservations to search for talented scouts, strong young people with the skills of silent movement over rough terrain. They were specifically looking for men with

outstanding, almost supernatural, tracking abilities. It was noted that these carefully selected people were real experts in the field of tracking and survival.

What was the disappointment when all the abilities of the recruits, their "sixth sense", intuition, the ability to see secret signs on the ground, the feeling of approaching the enemy ..., disappeared in an unknown way.

Expensive examinations and testing results, amounting to hundreds of pages of government research, allowed us to determine that the reason for this turned out to be very banal. The blame for everything was the short-cropped hair. Of course, conclusions were drawn for such a contingent, long hair was left.

- According to the apocryphal "Book of the Existence of Heaven and Earth", Samson is an Old Testament hero, who became famous for his exploits in the fight against enemies, wore long braids that gave him heroic strength. When Samson broke his vow of celibacy to the gods and fell in love with Delilah, he revealed a secret to her under the "drunken bench": "If you cut my hair, then my strength will depart from me." The insidious lover waited until the man fell asleep and cut off seven braids from his head. Samson immediately weakened, which his enemies took advantage of - blinded him and forced him to work at the mill.

But when Samson's hair grew back, his strength returned to him, and he destroyed the building where the enemies were.

- A woman with cropped hair was considered disgraced, and a similar opinion was present among all peoples.

- A woman with long hair has such a powerful energy that she is able to create a protective circle for her beloved man, protect him with her energy from any troubles. By the way, the husband gets protection from his wife when he combs her hair.

- The Slavs had such a tradition. A woman could only let her hair down at home or in nature. For the simple reason that loose hair (and even more so shorn) absorbs all the negative energy.

Have you ever wondered why the army always shaves "BALD"?

In Europe, the Roman Emperor Nero was the first to organize hair cutting, who ordered the consul to cut all foreign legions bald. When the consul, the commander of the foreign legions, asked the Emperor Nero why this was necessary, he replied: "I do not want them to think, it is enough for me that they only carry out my commands and orders."

It can be added that in the Russian lands, hair cutting began to be practiced only with the advent of Christianity.

There is evidence that women with long hair, carrying a child, rarely suffer from toxicosis.

Human hair, including the facial hair of men, not only directly supplies the brain with information, hair also emits energy, electromagnetic energy is radiated by the brain into the environment.

This was established using the Kirlian effect, when a person was photographed first with long hair, and then after a haircut. When the hair is cut, the reception and sending of signals to the environment is much more difficult.

N.V. Levashov said that our male ancestors did not cut their hair, and it was customary for some peoples to cut them, but haircuts were far from short. Woven braids in women, falling down the spine, were a special store of energy potential.

Hair plays an especially important role at an early stage of development; it acts as an antenna for receiving primary matter (in approximations to the horse literacy of modern science - "dark"). That is, long thick hair maximally saturates a person with energy.

It is possible to draw certain conclusions that girls in primary school develop faster, because they do not get their hair cut as often as boys.

The color of the hair depends on the amount of arsenic in it. The more of it, the darker the hair.

Interestingly, a person who has experienced a very big grief is advised to get a haircut as soon as possible.

And for the same reason, under no circumstances should you cut small children's hair. There is a belief that a child must be cut bald in year one. However, this prejudice is far from harmless. The child actively learns about the world, learns every second of his life, and he just gets his entire memory cut off. He starts learning from the beginning. There's a developmental lag.

I remember the story of my friend. She studied "excellently", an athlete from the Komsomol, a braid to the waist. And then she managed to make a fashionable haircut just before the exams. And what do you think? She failed her exams. She just could not remember anything from what she knew yesterday at five. She cut off her memory.

Many people believe that hair should never be dyed.

Here is an example of one of these arguments:

The color of objects arises mainly in the process of wave absorption. The red vessel looks red because it absorbs all the other colors of the light beam and reflects only red. When we say, "This cup is red," we actually mean that the molecular composition of the surface of the cup is such that it absorbs all light rays except red ones.

So, your hair has a certain color, as we know, there are no pure colors, hair shades are diverse and very complex. Based on the above, hair absorbs energy flows with a certain wavelength. And exactly the energy that your body needs. What happens when you dye your hair? Your body begins to receive energy that is alien to it.

And what is the result? That's right, disease. So, women, think a hundred times whether it's worth painting over gray hair, whether it spoils you so much. By the way, French women, who are considered the ideal of style and taste, have never painted over gray hair.

However, N.V. Levashov, in complete denial of modern chemical dyes, allowed, if necessary, the use of natural and organic.

Now I would like to look at this more or less understandable question about hair cutting, in the light of the discoveries of A.M. Khatybov and the events related to the capture and enslavement of our planet and people, respectively, by the parasitic Ebrov civilization.

While the development of our civilization was tent-like in nature, within a limited area, under the control of individual UFOs, methods of controlling people were of a simpler nature (perimeter fencing with a power dome).

However, when the interventionists decided to recreate the partially destroyed grids of the atmosphere, substituting their more primitive cubic ones and recreate the Brain of the Earth in order to use the entire territory of the planet, the question arose of tighter control.

It is known that each hair consists of 14 different elements, including gold. The presence of this element in human hair appeared for a reason. Khatybov's discoveries allow us to understand these reasons.

Gold was obtained from isotopes of uranium, and what is considered to be a stable element in the periodic table is actually an isotope. Modern science does not know this or simply does not want to notice it, although if gold has a bundle of 32? 53, then devices can detect the presence of radiation emissions.

If the bundle has a reduced potential, then there are no devices for detecting these emissions and there cannot be, however, the emissions themselves are present.

In total, we have 24 variants of "stable isotopes" in gold, the lifetime of each is more than 4,000 years. From that moment on, gold began to serve as a label for identifying people who should always be under the control of the System (rings, chains, medallions, earrings, gold embroidery, etc.).

In humans, feedback (control results) began to be carried out through the cerebellum as a structure - a concentrator with the use of antennas (hair).

In North America, the Indians removed the scalp, thereby removing the antennas and depriving the brain of transmitting anything. There is evidence that the custom of scalping was also common among many nationalities in Europe.

Gold, as a label for biostructures, has a bundle in a chain of octaves 32, 42, 53, which allows the Brain of the atmosphere to track "its" biostructures, i.e., individuals with some kind of introduced brain genotype.

Currently, when recreating our native Earth Control System, people's connection with it becomes key for their development and survival in the new, rapidly changing environmental conditions.

For this reason, it is very appropriate to read the answer of B.V. Makov on this issue:

The main burden of receiving the energy-informational translation of the brain and acquiring a contact state with the Control System is assigned to two brain states: antineutrino and neutrino, both in the non-inert state of energies. These two brain states have no vegetation at all. In this regard, the main flow of incoming information does not depend on the density of the vegetation placed on the head.

Another question related to the elements of "feedback".

There is a feedback information connection, both in the human Brain and in its flesh.

Now we would not like to publicly consider the true possibilities of feedback, because they are very vulnerable, and there are still a lot of "Good helpers". Let's save people from "Injuries" together!!!

You should not have incorrect information about the "uselessness" of hair in general.

Hair, on the one hand, has its origin (growth), as waste products of metabolic processes of brain cells. So, they are far from superfluous. If the hair has fallen out, it does not mean that their conditional root system has been eliminated. It can be restored.

In the absence of hair, the conditional root system performs the same function, only with a greater load. Don't be sad! We are taking measures to restore hair; intermediate positive results have been achieved! There is such a joke in certain circles: "A bald head is suede, with a hairline inside." Treat this with humor and do not artificially introduce yourself into a state of inferiority!

In general, the conclusions are obvious. If you want to make friends with your head, make friends with your hair!
